

Knowledge Transfer (KT) for pacific catalog revisions

Note:

- KT video part-1 on gdrive ('product' catalogs)
<https://drive.google.com/drive/folders/1h5GMguBbjGWWe-m01siuC5B57Til1D2j>
Passcode: =ZjaL1HQ
- KT video part-2 on gdrive (content catalogs, global accounts, image-generation)
<https://drive.google.com/file/d/1Gmcd54NOR6OyRsutlF7Sqx5YE4-bw6KR/view?usp=sharing>
Passcode: !3j3ER\$M

Topics:

Product catalog formats (general info)

- data connect
- data hub
- engagement

Demo catalogs

- product catalogs
 - 6 total, including 'global' versions
 - pacific home
 - pacific apparel
 - pacific supply
 - pacific homehsc (subset of pacific home)
 - pacifichome_global (English, German)
 - pacificsupply_global (English, German)
- content catalogs
 - 5 total
 - pacific home
 - English
 - German
 - pacific apparel
 - English
 - pacific supply
 - English
 - German

Catalog revision scripts

- Product catalogs
 - Python 3.x scripts
 - All catalog revisions use a similar code structure (details in video walk thru)
 - All have similar folder structure
 - actual scripts (*.py)
 - subfolder 'data', then 'data/input', 'data/output'
 - Outputs:
 - pacific home, pacific apparel, scripts generate revised version in all three formats
 - also output sorted list of all attributes in the catalog
 - helps to configure them in tools->CMUI OR datahub->item collections

- Content catalogs
 - similar folder structure as product-catalog
 - actual content-files downloaded from CMS using CMS-apis and then construct dataconnect-style format

Post-revision ingest, index steps

- 'data/output' has python scripts to ingest/index into dataconnect
 - can ingest/index first to staging, validate, then to production
- for datahub, single script does both steps using workspaceID, collections, ...
 - collections->destination defines target = staging or production
- *Note: I have used a 'test' account (pacific supply mindcurv) to test some catalog changes even before they are indexed in actual account. This 'mindcurv' account was created sometime ago to support a partner 'mindcurv' but then abandoned. Therefore using it for testing purposes is OK*

Post-index validation

- wait to make sure indexing is successful (check tools->catalog UI)
 - then wait just a few seconds/minutes to make sure all datacenter are updated
- (by Discovery)
- then use the "bloomique" tool to search for some keyword
 - then configure SPA as needed and validate results there
